

Day 15 of training

why react is most prefers as compare to html css js ?

Component-Based Architecture

- React lets you split your UI into reusable components (like building blocks).
- Example: A `Header`, `Footer`, or `Button` can be a component used everywhere.
- Why better than plain HTML/JS? Because updating one component doesn't affect the whole page.

State Management

- React has **`useState`**, **`useReducer`**, etc., to manage data (state) in your app.
- Example: A shopping cart updates quantities dynamically.
- Doing this with plain JS is messy and harder to maintain.

Efficient Updates with Virtual DOM

- React uses a Virtual DOM **to** only update the parts of the page that change, instead of reloading the entire page.
- Plain HTML/JS updates the whole page or manually changes elements — slow for big apps.

Reusable & Scalable

- Components and state make your code **organized** and **scalable**.
- HTML/CSS/JS alone can become **messy** when the project grows.

Strong Ecosystem

- React works well with tools like **Vite**, **Webpack**, **Tailwind CSS**, and libraries like **React Router**.
- You can easily build **modern, responsive, and interactive web apps**.

Community & Job Market

- Huge community → tons of tutorials, libraries, and support.
- Most companies use React → higher demand for jobs.
