

Day 2 of training

Form tag

The <form> tag in HTML is used to create an interactive section on a web page that allows users to input data and submit it to a server for processing.

It can contain input fields, checkboxes, radio buttons, submit buttons, and more.

Learn about form tag attributes like :- for , type ,id ,value ,action ,name, placeholder ,required

HTML Attribute Uses

Attribute

Tag Used In Use / Purpose for

<label>

Connects the label to an input using the id of the input. Helps when clicking the label to focus the input.

type

<input> -Defines the type of input (text, password, email, submit, etc.).

Id -Most tags Gives a unique identifier to a tag. Used for styling (CSS) or scripting (JavaScript).

Value -<input>, <button>

Sets the default value shown in an input box or button.

action

<form>-Tells where to send the form data when submitted.

name

<input>, <form>

Gives a name to the element. Used to identify the data on the server side.

placeholder

- Use: Shows a hint or example text inside the input box before the user types.
- It disappears when the user starts typing.

- Used in: <input>, <textarea> required
- Use: Makes a field mandatory. The form won't submit unless this field is filled.
- Used in: <input>, <textarea>, <select>

—> **Understand radio button**

A radio button lets the user select only one option from a group of choices.

——> **drop down list**

A drop-down list allows users to choose one option from a list that appears when clicked
