

DAY 22 of training

What is GitHub?

- **GitHub** is an **online platform** for storing and sharing code using **Git**.
- It helps developers **collaborate**, track changes, and manage versions of projects.
- Key points:
 - **Version control**: Keeps history of all changes.
 - **Collaboration**: Multiple people can work on the same project.
 - **Remote backup**: Your code is safe online.
 - **Pull requests & issues**: For reviewing code and tracking tasks.

Difference between Git and GitHub:

- **Git**: Tool to track changes in your local project.
- **GitHub**: Cloud platform to store Git repositories online.

Commonly Used Git Commands

Setup

Initialize a repository

Add changes

Commit changes

Push changes

Why Use Git and GitHub?

1. **Version Control**:
 - Git keeps track of every change you make.
 - You can go back to a previous version if something breaks.
2. **Collaboration**:
 - Multiple people can work on the same project without overwriting each other's work.
 - Pull requests let teammates review and approve changes before merging.
3. **Backup & Accessibility**:
 - Your projects are safely stored online.
 - You can access them from anywhere.
4. **Portfolio & Resume**:
 - GitHub shows your projects publicly, which is great for job applications.
