

Day 4 of training

What is CSS?

CSS stands for Cascading Style Sheets.

It is used to style HTML pages — basically, it makes your website look good!

What Does CSS Do?

Changes colors

Changes fonts and text size

Controls layout, margins, spacing

Makes websites responsive (look good on mobile)

```
h1 {  
  color: red;  
}
```

This means:

Selector = h1 → (Heading)

Property = color → (What you want to change)

Value = red → (How you want it)

There are three types of css

1) inline css 2) internal css 3) external css

--> inline css

CSS written directly inside an HTML tag.

Used for small, quick changes.

-> Not good for big projects.

--> internal css

CSS written inside a <style> tag in the same HTML file (in <head>).

Good for styling a single page.

--> **external css**

CSS written in a separate file (like style.css), then linked to the HTML.

Best for big websites.

Easy to reuse and manage.

| **Selector Type** | **Example** | **What it does**

-----	-----	-----
Universal	`* {}`	Selects **all** elements
Tag	`p {}`	Selects all ` <p>` tags</p>
Class	`.name {}`	Selects elements with **class="name"**
ID	`#main {}`	Selects element with **id="main"**
Group	`h1, p {}`	Styles **both h1 and p**
Inside Element**	`div p {}`	Styles ` <p>` inside `<div>`</div></p>
